Project Design Phase
Proposed Solution Template

Date	03 October 2026
Team ID	SWTID-2026-5297
Project Name	Script-Controlled ACL - Restrict Record Based on Field value
Maximum Marks	2 Marks

Proposed Solution Template:

Project team shall fill the following information in the proposed solution template.

S.No.	Parameter	Description
1.	Problem Statement (Problem to be solved)	Default Role-Based Access Control (RBAC) in ServiceNow allows broad global visibility across table records. Without custom script filtering, departmental users can view and manipulate unauthorized records belonging to other branches (e.g., ECE, CSE), leading to data privacy breaches and compliance risks.
2.	Idea / Solution description	Implement script-controlled Access Control Lists (ACLs) on the custom table u_institution_details. The solution combines dynamic server-side JavaScript filtering (evaluating current.u_branch == 'EEE' and gs.hasRole()) to strictly restrict Read, Create, Write, and Delete CRUD operations across custom security roles (bb1–bb4).
3.	Novelty / Uniqueness	Unlike standard declarative ACLs or basic UI Policies that only affect form visual controls, this script-controlled ACL logic operates at the core database transaction layer. It enforces record-level isolation dynamically across both list views and form views while granting effortless administrative bypasses for security auditing.
4.	Social Impact / Customer Satisfaction	Ensures absolute multi-tenant data confidentiality and institutional privacy across departments. Department heads and EEE users gain full data governance confidence, knowing confidential student and operational records are protected against unauthorized cross-branch exposure or accidental deletion.
5.	Business Model (Revenue Model)	Delivered as a specialized, reusable Enterprise Governance & Security Plug-in module for ServiceNow instances. Offered under a tiered subscription licensing model for enterprise clients needing granular, field-level and value-driven access isolation without expensive custom architecture overhauls.

6.	Scalability of the Solution	Highly scalable across any ServiceNow table schema. The underlying script logic easily expands to accommodate additional branch parameters (e.g., MECH, CIVIL) or extra custom roles (bb5+) without requiring database redesigns or platform performance penalties.
